AASO1460-AASO1502 encode for novel human secreted proteins. The invention relates to 43 novel human secreted proteins (AAU01040-AAU01082) and their gene sequences which can be used in gene therapy. The secreted proteins of are useful to prevent, treat or ameliotate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. The secreted proteins are also useful in diagnosing a pathological condition. Or susceptibility to a pathological condition. Antibodies to the secreted proteins can also be used in alleviating symptoms associated with disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme inked immunosorbent assays (ENISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rehumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection. The polypeptides can also be coular disorders e.g. corneal infection. The polypeptides can also be used an ain due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in the constraints. The polypeptides can also be used as a food additive or increase the infection can also be used as a food additive or increase the increase the increase the increase the increase the increase of themetants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1227

ö New human secreted proteins and nucleic acids, useful for detecting treating cancer or other hyperproliferative disorders, autoimmune disorders, inflammatory disorders, HIV disease, hepatitis or anemia.

Claim 21; Page 1274-1275; 2474pp; English

ABZ73281-ABZ73697 represent cDNAs corresponding to 391 human secreted protein genes, and ABP00947-ABP01363 represent the proteins they encode. ABZ73689 ABZ74687 represent human secreted proteins they encode. Convention also encompasses antibodies specific for the secreted proteins, the use of the secreted proteins in drug screening and recombinant vectors and host cells comprising a nucleic acid of the invention. The secreted proteins are thought to be involved in biological activities associated with cellular signalling, cellular differentiation, cell migration, prohormone activation and neurotransmitter activity. The secreted proteins, and modulators of protein and required proteins. And encoding them, antibody fragments specific for the secreted proteins, and modulators of protein activity are useful for diagnosing or treating cancers or other activity are useful for diagnosing or treating cancers or other their nucleic acids may also be used in the treatment of autoimmune disorders, inflammatory disorders, diseases involving anglogenesis, AIDS (acquired immunodeficiency syndrome), hepatitis, anaemia, and to promote wound healing. Nucleic acids of the invention may be used for chromosome identification, chromosome mapping, in gene therapy, for identifying individuals from minute biological samples, as hybridisation probes, and assembles as moderned a human and a nuclear and a managers. protein-encoding cDNA clone of the invention

Sequence 2847 BP; 706 A; 681 C; 719 G; 740 T; 0 U; 1 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1520
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1047
                                                                                                                                                                             secreted proteins. The DNA and protein sequences of the invention are useful in the treatment of cardiovascular disorders, such as: arrhythmia, atherosclerosis, stroke, endocarditis, congestive heart failure, rheumatic heart disease, cardiomyopathy, haemorrhoids, varicose veins, migraine, or thrombosis. The DNA and protein sequences may also be used for treating or preventing: neural disorders, immune system disorders, pulmonary disorders, reproductive disorders, gastrointestinal disorders, pulmonary disorders, renal disorders, proliferative disorders and/or cancerous diseases. The present CDNA sequence encodes a human secreted protein of the invention. NOTE: The present sequence is shown on the WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 547

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

// note="IRR RI; Region: Leucine-rich repeats (LRRs), ribonuclease inhibitor (RI)-like subfamily. LRRs are 20-29 residue sequence motifs present in many proteins that participate in protein-protein interactions and have different functions and cellular locations. LRRs correspond to structural units consisting of a beta strand clxxlxxxxV/Cxl conserved pattern) and an alpha helix. This alignment contains 12 strands corresponding to 11 full repeats, consistent with the extent Observed in the subfamily acting as Ran GTPase Activating Proteins (RanGAPI)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note="PAAD_DAPIN; Region: PAAD/DAPIN/Pyrin domain. This domain is predicted to contain 6 alpha helices and to have the same fold as the pfam00531 domain. This similarity may mean that this is a protein-protein interaction domain."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADJOANMENT VILLEMENT CONTROLL CAND TO THE TITLE CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL CONTROLL

EDO human cDNA sequencing project supported by Ministry of

EOOnomy, Trade and Industry of Japan; cDNA full insert sequencing:

sesarch Association for Biotechnology (RAB); cDNA library

onstruction: Helix Research Institute (HRI) (supported by Japan

est Technology Center etc.); 5' - & 3' end one pass sequencing: RAB,

RI, and Biotechnology Center, National Institute of Technology and

valuation; clone selection for full insert sequencing: HRI and

AB; annotation: HRI and RAB.

Novel isolated PAAD domain containing polypeptide useful for inducing apoptosis by inhibiting nuclear factor kappa B activation and in gene therapy for treating cancer.

Claim 2; SEQ ID NO 23; 93pp; English

The invention describes an isolated PAAD domain containing polypeptide (I) comprising 80% identity to the amino acid sequence of PAAD and nucleotide binding protein (RAM) 2-6, pyrin 2, apoptosis-associated speck containing a caspase recruitment domain (ASG)-2 fully defined in specification, where (I) is biologically active. (I) is useful for identifying a (I)-associated polypeptide, an agent altering that association and agents that modulate PAAD domain mediated inhibition of nuclear factor kappa B (NFkappaB). A NB-ARC domain polypeptide is useful conclear factor kappa B (NFkappaB). A NB-ARC domain polypeptide is useful conclear factor kappa B (NFkappaB). A NB-ARC domain polypeptide is useful conclearing that concising, veroxine receptor signaling caspase—mediated protechysis or concleasing, cytckine receptor signaling caspase—mediated protechysis or concluded and death (apoptosis) inflammation, cell adhesion or other cellular concludentical processes. (I) is useful for treating cancer pathologies, keratinocyte, hyperplasia, neoplasia, keloid benign processence; concludentical processes. (I) is useful for treating cancer pathologies, keratinocyte, hyperplasia, neoplasia, keloid benign processences; concluded to prodisers and in arteries following balloon and opplasia, keloid benign processence; concludes and ulcerative colitis, graft concert and scapes such as allergies, arbritis, concert as parkinson's and Alzheimer's disease and ulcerative colitis, graft concert or monitoring cancer concern manner pand.

The sequence encodes human PAAD and nucleotide binding protein

signal transduction, particularly inflammation, also impaired signa and antibodies. involving proteins 

Fig 1; 116pp; German 5, The present invention relates the DNA and their encoded proteins, where the proteins contain at least one PYD (pyrin) domain. These can be used to treat diseases associated with impaired intracellular signal transduction, particularly inflammation such as psoriasis, arteriosclerosis, bacterial or viral infections (particularly meningitis and pneumonia), multiple sclerosis, rheumatoid arthritis, asthma, sarcoidosis, glomerulonephiris and osteoarthritis, and also Alzheimer's and Parkingon's diseases. The present sequence is a coding sequence of the invention

The invention comprises the amino acid and coding sequences of human PYRIN proteins. The PYRIN protein and DNA sequences of the invention are useful for modulating and diagnosing stress-related, apoptopic and inflammatory responses. The PYRIN protein and DNA sequences are useful for treating: inflammatory disorders and immune system disorders (e.g. Crohn's disease, reactive arthritis, multiple sclerosis, contact dermatitis, psoriasis, graft rejection, allergies, viral infections and bacterial infections); cancer (e.g. leukaemia); autoimmune disorders (e.g. systemic lupus erythematosus and arthritis); and neurological diseases (e.g. Alzheimer's disease and Parkinson's disease). The PYRIN protein and DNA sequences may also be used in screening assays, detection assays (e.g. chromosomal mapping, tissue typing or forensic biology), predictive medicine (e.g. diagnostic assays, clinical trials and predictive medicine (e.g. diagnostic assays, clinical trials and pharmacogenomics) and transcription profiling. The present DNA sequence encodes a human PYRIN-8 protein

ADC30316 standard; cDNA; 3306 (first entry) 18-DEC-2003 ADC30316; RESULT 4 ADC3 031 

Human novel cDNA sequence, SEQ ID NO:398.

Human; diagnostic; drug screening; forensics; gene mapping; biodiversity assessment; Parkinson's disease; Alzheimer's disease; neurodegenerative diseases; anaemia; platelet disorder; wound; burns; ulcers; osteopororsis; autoimmune disease; cancer; molecular weight marker; food supplement; antiparkinsonian; nootropic; neuroprotective; antianaemic; anticoagulant; thrombolytic; vulnerary; antiulcer; osteopathic; immunosuppressive; antiinflammatory; cytostatic; gene therapy; chromosome 19; gene; ss.

```
The invention relates to 971 novel human CDNA sequences (ADC29919-CC ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human CDNAs. The invention additionally encompasses expression to recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; an antibody of polymucleotides or polypeptides of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of peventing, treating or ameliorating a medical condition; kits comprising polymucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention. The invention; methods for the identification of compounds that modulate the expression or activity of the polymucleotide and/or polypeptide or activity of the polymucleotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention or expression or activity of the polympetides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other types of data and products dependent on DNA and anion acid sequences. They are traing diseases such as Parkinson's disease, Alzheimer's disorders, wounds, burns, ulcers, osteoporosis, anteniam, platelet the combinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human cDNA sequence of the invention. Note: The sequence of the invention contained in pereronic format directly from MIPO at
 New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

New human nucleic acid-associated proteins (NAAP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant NAAP expression, e.g. cancer, hepatitis, AIDS, atherosclerosis, infections.

Claim 5; Page 160; 162pp; English.

The invention relates to an isolated polypeptide comprising one of 10 human nucleic acid associated protein (NAAPI-10), or a biologically active or immunogenic fragment of the polypeptide, and their encoding nucleic acid. Also included are a recombinant polynucleotide comprising a promoter sequence operably linked to the polynucleotide, a cell transformed with the recombinant polynucleotide, a transgenic organism comprising the recombinant polynucleotide, an anti-NAAP antibody, screening for a compound that is effective as an anti-NAAP antibody.

Soreening for a compound that is effective as an anti-NAAP antibody, correcting an expression profile of a sample containing the polynucleotides and an array comprising different nucleotide molecules affixed on a solid substrate, nucleotide molecule comprises a first coligonucleotide or polynucleotide sequence specifically hybridisable with at least 30 contiguous nucleotides of the target (NAAP) polynucleotide.

The polypeptides and polynucleotides are useful in diagnosing, treating an active contraction. and preventing diseases or conditions associated with the decreased expression or overexpression of NAAP, such as cell proliferative diseases (e.g. cancer, atheroscierosis, hepatitis), neurological disorders (Parkinson's disease, Alzheimer's disease, stroke, epilepsy), developmental disorders (renal tubular acidosis, anaemia, glaucoma, hypothyroidism), autoimmune/inflammatory disorders (AIDS (acquired

immunodeficiency syndrome), allergies, atopic dermatitis, arthritis) and infections (e.g. bacterial, viral, parasitic, protozoal, fungal) and many other diseases and disorders listed in the specification. These are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of NAAP. The NAAP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polynucleotide and compounds that specifically bind to or modulate the activity of the polypeptide. The microarray is useful in monitoring

WPI; 2003-140627/13. P-PSDB; ABU99120 New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing or pharmacogenomics

Claim 20; Page 99-100; 332pp; English.

The invention describes an isolated polypeptide (I) comprising any of 27 (18-961 residue amino acid sequences, given in the specification, a mature form of them, a sequence that is at least 95 % identical to them, or a sequence having one or more conservative substitutions in them. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease selected from a pathology sociated with the polypeptide. The NOVX polypeptides, polynucleotides and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosciarosis, cancer, diabetes, immune disorders, AIDS, obesity, asthma, haematopoietic disorders, Parkinson's disease, Alzheimer's disease, infections, multiple sclerosis, cancerassociated cachexia, and other wasting disorders associated with chronic diseases. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis,

New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing or

Claim 20; Page 98-99; 332pp; English.

The invention describes an isolated polypeptide (I) comprising any of 27 118-961 residue amino acid sequences, given in the specification, a mature form of them, a sequence that is at least 95 % identical to them, or a sequence having one or more conservative substitutions in them. The polypeptide is useful in manufacturing a medicament for treating a sociated with the polypeptide. The NOVX polypeptides, polynucleotides as casociated with the polypeptide in treating or preventing NOVX-associated and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, cancer, diabetes, immune clisorders, AlDS, obesity, asthma, themosciatic disorders, parkinson's disease, Alzheimer's disease, infections, multiple sclerosis, cancer-clisorated cachexia, and other wasting disorders associated with chromic cliseases. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. cultipodies that bind immunospecifically to NOVX substances for use in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The nucleic acids are further used as the continue, and pharmacogenomics. The polypeptides are also useful as continues. This sequence encodes a novel human G-protein coupled receptor continued to the continue of the coupled receptor continued to the continue of the coupled receptor continued to the continued of the continued of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the couple of the related protein NOV

New HLRRBM1 nucleic acids for preventing, treating or ameliorating e.g. proliferative disorders, immune conditions, a disorder related to aberrant apoptosis modulation or developmental disorders.

Claim 1; Fig 1A-E; 371pp; English.

The present sequence encodes a human leucine-rich repeat containing protein, designated Hirrem. Hirrem polypeptides and polynucleotides are protein, designated Hirrem. Hirrem polypeptides and polynucleotides are protein, designated Hirrem. Hirrem polypeptides and polynucleotides are as a proliferative disorder, immune condition, or a disorder related to aberrant apoptosis modulation, either directly or indirectly, and in modulating signal transduction activity in various cells, tissue and conganisms. They are also useful for treating, preventing, or diagnosing diseases of heematopoietic cells, autoimmune disease, graft-versus-host disease, allergic conditions (e.g. asthma), cardiovascular disorders, and neurological diseases, and for increasing the organisms ability to synthesize and/or release pheromones. The polypeptide may also be used in treating, preventing or ameliorating pulmonary disease (e.g. chronic obstructive pulmonary disease, haematopoietic disease, hyperresponsiveness), reproductive disease, haematopoietic disease, constructive pulmonary disease, haematopoietic disease, immune and inflammatory disorders (e.g. systemic lupus crids may further be used in firlammatory disorders (e.g. systemic lupus acids may further be used in firlammatory disorders (e.g. systemic lupus acids may further as melecular weight markers, as a diagnostic probes, in continuing immune responses in electrial parkers, as adiagnostic probes, in continuing immune responses

WPI; 2003-371981/35. P-PSDB; ADC32968 New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

Example 2; SEQ ID NO 2283; 1185pp; English.

The invention relates to 971 novel human cDNA sequences (ADC29919-CC ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression the novel human cDNAs. The invention additionally encompasses expression convectors and host cells comprising a nucleic acid of the invention; an antibody against a polypeptide of the invention; and methods of crecombinant production of the invention; and methods of invention further discloses methods of peventing, treating or ameliorating a medical condition; kits comprising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention are discloses methods of peventing, treating or ameliorating a medical condition; kits comprising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of the corresponding to the compounds that modulate the expression or activity of the polymelectide and/or polypeptides and/or monoclonal antibodies for carrying out the methods of the corresponding to the cDNA sequences of the invention are corresponding to the cDNA sequences of the invention are und/or monoclonal antibodies and polypeptides encoded by the contrigs (ADC31861-ADC31861-ADC31861). The nucleic acids and polypeptides encoded by the contrig of dentification of mutations responsible for genetic disorders or other traits, for assessing blodyersity, and in producing sequences or caract. The nucleic acids and products dependent on DNA and anion acid sequences. They are also used any also be used as hybridisation probes or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides and as food supplements. The present sequence represents a human contig sequence used in an example of the invention. Note: The sequence data for the present expresents a human contig observed intervalvance of the present exp ftp.wipo.int/pub/published\_pct\_sequences.

```
The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by by the technique of SBH (sequencing by Mybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forenside, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probles, as oligomers for PCR, protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense DNA or RNA. The purified polypeptide is useful for generating antisbodies specific for it. The present sequence is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed construction of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed construction of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a colypoptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders convolving aberrant protein expression or biological activity. The polypoptide and polynucleotide sequences have applications in diagnostics, for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences.
